RE The KAFRIADA pilot — what we are building, explained simply

What we are building, in plain words

Aliyu,

Thank you for the detailed response. Your feedback made the plan better, and I have accepted almost all of it. This memo describes, in everyday language, exactly what the team will build over the next eight weeks, what your suggestions changed, the three points where I must hold my ground and why, and the five confirmations I need from you before work starts. A separate technical document exists for the developers; this one is for you and for anyone you want to show it to.

1. The product, described simply

Think of KAFRIADA as three familiar things combined into one website that works on any phone:

- 1. An ID card office for athletes.** A player registers free of charge and immediately receives a permanent KAFRIADA number and a personal page with a QR code. Anyone who scans the code sees the player's official page. If the player pays the verification fee, their photograph and full details appear, with a verified badge. If they have not paid, the page still exists, but without the photo — like a form that is filled but not yet stamped.
- 2. A register book for clubs.** A club signs up free, and once we approve it, it can build its squad list by inviting players using their KAFRIADA numbers. When a player moves from one club to another, both clubs record the movement on KAFRIADA. No money passes through us for transfers — the clubs and the LGA sport organizations handle that between themselves as they always have. What we hold is the **proof**: who moved, from where, to where, and when. And here is the part I like most from your feedback: the buying club must open a KAFRIADA account to confirm the transfer. Every real transfer in Jigawa recruits a new club for us automatically.
- 3. A sports news channel.** Inside the app there is a news section that we control. We post transfer announcements, top scorers by state and LGA, upcoming trials and events, success stories, and sponsored adverts. This gives every user a reason to open the app daily — not only to look at their own QR page. Exactly as you described it: the social home of KAFRIADA.

2. Your feedback, and what I did with each point

YOU SAID	WHAT I DID
Players cannot pay at the start; registration and rosters must be free	Accepted fully. Everything is free to join. Only the photograph and verified badge require payment — and the price drops to ₦2,500 for players, in line with your own calculations. Clubs pay ₦15,000 for their verified status.
Keep transfers, free, as records — money handled offline by LGA organizations	Accepted fully, and built as your growth engine (the buying club must join to confirm).
Marketplace as the news home, with posts by state and LGA	Accepted fully. In the pilot, only our admins post; users read, and sponsors can buy advert slots. User posting comes later.
No under-18 players at launch	Accepted fully, and it saves us significant legal work. The system checks date of birth and only admits adults for now.
Scouts should be present from day one, free	Accepted. Scouts get free accounts that can browse verified players. Their paid subscription and our commission on deals come after the pilot, when we have something worth charging for.
Team of 3, budget kept as low as possible	Accepted. Three developers, one shared system, and running costs of roughly the price of one smartphone per month.
Start in Jigawa, with LGA coordinators and Birnin-Kudu as the anchor	Accepted fully. The plan below is built around your 27-LGA network.

3. The three points where I must hold my ground

First: the wallet will be a record book, not a vault — for now. You asked for a wallet so that all money in the system stays cashless, and you also suggested we could drop the payment company. We cannot do both, because money has to enter the system through some door, and the payment company (Paystack) is the only legal door that does not require a banking licence. Here is the important part: if KAFRIADA *holds* people's money in a way they can withdraw or send to each other, the Central Bank will treat us like a bank, and that licence battle could stop the pilot completely. So in the pilot, every user has a wallet page that faithfully shows every naira they paid and every reward we credit them — a clean record book — but the actual money sits safely in the company account, having entered through Paystack. A player with no bank card simply hands cash to our LGA coordinator, who completes the payment on their phone on the player's behalf — the same way OPay agents work in the villages. When we are funded and licensed, the record book becomes a true wallet without rebuilding anything.

Second: eight weeks, not four. In four weeks I can show you something that looks finished. But 6,750 people are going to trust this system with their identity and their money, and the part that earns that trust is invisible: payment confirmations that never miss, records that cannot be quietly

altered, backups that have been tested, doors that are locked against intruders. That work is the second four weeks. You lose nothing by this: from week four, a working version is in the coordinators' hands for training and mobilization, so the marketing clock starts early — only the public launch waits until the system is genuinely safe.

Third: the team agreements must be signed before work begins. Your deferred-payment model can work, and I respect the faith behind it. But an arrangement where people work now and are paid from future revenue — plus a shared 5% of the first ₦100 million — must be written, precise, and signed before the first line of code: who gets what, when the clock starts, and what happens if someone leaves at week six. Verbal versions of such agreements are how founding teams scatter. I suggest this is Barr F's first assignment, and I will not start Sprint 0 without the signatures.

4. The eight weeks, in plain terms

WEEKS	WHAT EXISTS AT THE END OF IT
1	The foundations: accounts, security, and the full Jigawa map (all 27 LGAs) loaded into the system.
2–3	A player can register, get a KAFRIADA number, and share a working QR page.
3–4	Clubs can register and build squads. From here, coordinators begin training on the real system.
5	Payments work end to end: a player pays ₦2,500, the wallet records it, and our admin verifies them within 24 hours.
6	Transfers can be recorded, and the news section is live with state and LGA posts.
7	Testing, security checks, and making sure the language and steps are simple enough for a first-time user in Birnin-Kudu.
8	Launch: soft opening in Birnin-Kudu with the coordinators, then rollout across the 27 LGAs.

5. How we will judge success — the numbers we agreed

MEASURE	PASS MARK
Players registered	5,000 or more
Players who pay for verification	4% or more (100+ payments at ₦2,500)
Active clubs	81 — three per LGA — each with 15+ players on its squad
Verification speed	Under 24 hours, every time
Profile sharing	Growing week after week

If we hit these numbers, we walk into any investor's office with proof, not promises. If we fall short, we still have most of our capital and an honest answer about what to adjust.

6. The five confirmations I need from you

1. **The wallet as a record book** for the pilot, upgrading to a full wallet after funding and licensing — confirm.
2. **Prices:** ₦2,500 for player verification, ₦15,000 for club verification. Both can be changed later without rebuilding — confirm.
3. **Eight weeks** to launch, with coordinator training from week four — confirm.
4. **Signed team agreements before work starts** — please hand this to Barr F this week.
5. **Chapter O4 of the main document:** if you have its content, please send it; if not, we will simply renumber the chapters during the cleanup.

Reply with your confirmations — or your corrections — and the team starts. I will report to you at the end of every week, in this same plain format.

Respectfully,

Chief Technology Officer
